

Formatters

accept - jas sakam nazad

content type - eve ti

the Accept header—and the server picks one

of these, formats the response, and sends a content-type header in the response, indicating which it chose

Clients include the content-type header as part of POST requests to tell the server what sort of data it's sending

The input formatter is selected based on the content-type header of the request

```
services.AddControllers(configure =>
{
//ako go nema vo lista na outputformatter ke vrati status code 406 Not Acceptable
//json go ima vo listata toj e default
configure.ReturnHttpNotAcceptable = true;
configure.OutputFormatters.Add(new XmlDataContractSerializerOutputFormatter());
});
//.AddXmlSerializerFormatters();
```
