The following table lists the default rules for parameter binding.

HTTP Method	Query String	Request Body
GET	Primitive Type, Complex Type	NA
POST	Primitive Type	Complex Type
PUT	Primitive Type	Complex Type
PATCH	Primitive Type	Complex Type
DELETE	Primitive Type, Complex Type	NA

[FromUri] and [FromBody]

You have seen that by default Web API gets the value of a primitive parameter from the query string and complex type parameter from the request body. But, what if we want to change this default behaviour?

Use [FromUri] attribute to force Web API to get the value of complex type from the query string and [FromBody] attribute to get the value of primitive type from the request body, opposite to the default rules.
